

VORG COURSE 1

Luxury Fashion Compositing Taste

Master real Jacquemus and Rhode references one image at a time -
then build original VORG work.

The method: exact master studies, not generated substitutes

Results come from matching relationships, not copying software settings.

- Use one official source image at a time.
- Reduce it to values, shapes, light, color, and surface clues.
- Rebuild privately with real photography, CGI, and retouching.
- Compare at thumbnail size and 200 percent before calling it finished.
- Keep Jacquemus and Rhode as separate disciplines.

Eight weeks has one narrow commercial outcome

You are training a repeatable specialty - fashion compositing - not becoming a generalist.

- Take properly photographed people and products into polished campaign images.
- Use Blender only for geometry, reflections, shadows, depth, and set elements.
- Use Photoshop and Camera Raw for the still-image composite and final retouch.
- Use DaVinci Resolve 21 for Photo-page grading, motion, shot matching, and delivery where useful.
- Finish a six-image VORG campaign system, not one lucky image.

Private study has a hard boundary

Replicate to learn; create original work to publish.

- Official brand images are reduced-resolution references for criticism and education.
- Do not post the replicas as original work, sell them, or use them in VORG advertising.
- Do not remove logos, credits, or watermarks.
- Credit the source page and retain the manifest entry.
- The capstone uses VORG-owned photography and garments only.
- Generative images are excluded from the core practice method.

Give each application one clear job

STILL CAMPAIGNS

- Camera Raw: RAW development and local masks
- Photoshop: compositing, retouching, texture, export
- Blender: CGI objects, reflections, shadows, passes

MOTION / CAMPAIGN SYSTEM

- Resolve 21 Photo: still organization and grading
- Resolve Color: scopes, node grades, shot matching
- Fusion: motion composite only when motion adds value

The fastest workflow is the one that preserves product truth with the fewest handoffs.

Version baseline checked on 10 July 2026

- Blender 5.1 stable for course exercises; 5.2 was still a release candidate when checked.
- Photoshop 27.8 and Camera Raw 18.4.1 terminology.
- DaVinci Resolve 21, including the new Photo page.
- Interface placement can change; the course teaches decisions and names the current controls.
- Re-check official documentation before a production-critical workflow change.

The eight-week progression is cumulative

- Week 1: taste, hierarchy, and the master-study method.
- Week 2: photography and RAW source discipline.
- Week 3: premium shine and reflection design.
- Week 4: only the Blender skills that support compositing.
- Week 5: Photoshop integration and retouching.
- Week 6: color management and campaign consistency.
- Week 7: Resolve, motion restraint, and system QA.
- Week 8: six-image VORG capstone.

Taste is a chain of controlled decisions

Taste is not a moodboard. It is perception plus repeatable correction.

- Notice relationships before details.
- Explain why the hierarchy works.
- Reproduce the relationship deliberately.
- Remove what competes with the subject.
- Recognize when texture, light, scale, or color becomes fake.
- Translate learned control into original work.

Start every teardown with the three-second read

- What lands first?
- What is the second visual event?
- What is the emotional read before details?
- Does the image still work at phone-thumbnail size?
- If the answer changes after explanation, the hierarchy is weak.

Hierarchy concentrates contrast where the sale happens

- Name the hero, supporting subject, and negative space.
- Locate the sharpest edge and highest local contrast.
- Track where saturation is concentrated.
- Remove accidental highlights and bright background exits.
- Confirm the product is still readable without the caption.

Composition is controlled visual weight

- Map center, thirds, symmetry, and deliberate imbalance.
- Trace the largest three shapes before tracing details.
- Check crop pressure around hands, face, garment edges, and props.
- Use foreground, middle ground, and background to create depth.
- Flip the image to expose hidden imbalance and tangencies.

Estimate the camera before opening Blender

- Horizon placement reveals camera height.
- Parallel-line convergence reveals perspective strength.
- Compression suggests focal length but does not prove it.
- Subject scale depends on distance as much as focal length.
- Label estimates as estimates until camera metadata or on-set records confirm them.

Light is read through shadows and highlight shape

- Estimate key direction, source size, softness, and height.
- Separate fill from environmental bounce.
- Read the shadow edge before the shadow darkness.
- The highlight shape reveals the light or reflected card.
- All inserted objects must share the same light logic.

Surface language comes from gradients, edges, and microtexture

- Matte surfaces show broad tonal change with weak highlights.
- Gloss surfaces show the environment with controlled roughness.
- Metal has no diffuse shortcut - it is reflection design.
- Denim needs fiber and fold direction, not generic noise.
- Skin needs pores and local variation after retouching.

Color discipline protects hierarchy

- Name dominant, supporting, and accent hues.
- Control saturation by priority, not globally.
- Protect natural skin relationships.
- Watch black-point behavior in denim and chrome.
- Keep white garments dimensional through edge and highlight control.

Retouching is successful when the image stays physical

Product truth has veto power over polish.

- Preserve skin pores and garment texture.
- Clean dust without sterilizing the surface.
- Correct geometry without changing the product.
- Dodge and burn form; do not paint generic shine.
- Match grain after scale, blur, and color are already correct.

Seven fast tests catch most taste failures

- Thumbnail: does the idea survive at phone size?
- Squint: do three value groups remain clear?
- Grayscale: does color hide weak structure?
- Mirror: does balance collapse when flipped?
- Distraction: where does the eye go that does not sell?
- Shadow: do all elements share one world?
- Reality: does the composite hold at 200 percent?

01

Jacquemus master studies

Scale, sun, architecture, silhouette, and immediate visual ideas.

The Jacquemus reference set is broad, but the drills are narrow

Twenty official references are indexed. Only three become master studies so the work stays deep instead of turning into indiscriminate moodboarding.

J01 original reference - Le Bonheur - white/red look

Observe for three seconds, then write the first and second visual events before reading the analysis.

J01 - reduce the image before rebuilding it

ORIGINAL

GRAYSCALE

BLURRED READ

VALUE GROUPS

- First read: white torso, red lower mass, then face.
- Estimated hard sun from camera-left; shadow proves direction.
- Three large fields: sky/water, pale stone, red garment.

Rebuild J01 as a private master study

- Shoot a real model in a simple light garment.
- Match camera height and centered silhouette before color.
- Rebuild hard-sun direction and shadow edge.
- Grade sky, stone, skin, white, then red - in that order.
- Do not recreate the exact garment or publish the replica.

Target: hierarchy and light logic within 10 percent - not identity or wardrobe duplication.

J02 original reference - La Croisiere - architectural set

Observe for three seconds, then write the first and second visual events before reading the analysis.

J02 - reduce the image before rebuilding it

ORIGINAL

GRAYSCALE

BLURRED READ

VALUE GROUPS

- First read: central doorway and distant statue.
- One-point perspective carries the frame.
- Warm wood reflections create depth without clutter.

Rebuild J02 as a private master study

- Photograph a hallway or construct a simple Blender corridor.
- Match vanishing point and camera height first.
- Use practical lights as motivated sources.
- Preserve reflective floor gradients and dark edge framing.
- Insert one neutral object only after the empty set matches.

Target: believable camera match and interior depth before adding a fashion subject.

J03 original reference - La Casa - model and architecture

Observe for three seconds, then write the first and second visual events before reading the analysis.

J03 - reduce the image before rebuilding it

ORIGINAL

GRAYSCALE

BLURRED READ

VALUE GROUPS

- First read: pale blue silhouette, then burgundy bag.
- The horizon sits low enough to keep the figure dominant.
- Pastel planes separate by hue more than contrast.

Rebuild J03 as a private master study

- Shoot a full-length walk with clean garment edges.
- Match horizon and body scale before styling color.
- Keep face and skin neutral while separating sky, sea, and floor.
- Use one contrasting real accessory - not a copied product.
- Compare silhouette and crop at thumbnail size.

Target: a clean outdoor model frame with one controlled color event.

Premium shine is designed in the reflected environment

- Choose the highlight shape before changing roughness.
- Use large white cards for broad gradients and black cards for edge definition.
- Keep highlights below clipping so the material still has form.
- Add bevels and microtexture before adding bloom.
- A glossy slider cannot repair weak geometry or an empty reflection field.

Surreal scale stays believable when physics stays strict

- Camera perspective and focal length must match the plate.
- Contact and cast shadows must agree with the source light.
- Reflections must contain the same environment.
- Depth of field and grain must match after scaling.
- One simple impossible idea is stronger than many unexplained effects.

Jacquemus test: rebuild one relationship exactly

Do not combine the three references. Master one problem at a time.

- Choose J01 for hard-sun model discipline.
- Choose J02 for camera matching and architectural depth.
- Choose J03 for clean color separation and silhouette.
- Score against the source - not against how impressive the edit feels.
- Below 75: revise. At 85 with no realism errors: keep as a private portfolio study.

02

Rhode master studies

Cleanliness, intimacy, wet surfaces, skin truth, and tonal separation.

Rhode teaches control at close distance

Twenty official references are indexed across portrait, product, hand, set, and macro work. Three drills isolate portrait light, product cleanliness, and skin detail.

R01 original reference - Glazing Milk - hero study

Write the three-second read first. Do not begin with retouching settings.

R01 - reduce the image before rebuilding it

ORIGINAL

GRAYSCALE

BLURRED READ

VALUE GROUPS

- First read: eyes, then wet lip highlight.
- Warm skin sits against a quiet neutral field.
- Specular points stay small; texture remains visible.

Rebuild R01 as a private master study

- Shoot a consented portrait with a large soft source.
- Match crop and eye-line before retouching.
- Balance skin globally, then protect local color variation.
- Dodge and burn form without smoothing pores.
- Match hair black-point and lip highlight separately.

Target: intimate, polished skin that remains recognizably photographed.

R02 original reference - Glazing Milk - clean still life

Write the three-second read first. Do not
begin with retouching settings.

R02 - reduce the image before rebuilding it

ORIGINAL

GRAYSCALE

BLURRED READ

VALUE GROUPS

- First read: bottle silhouette, then vertical label.
- White-on-white separation comes from edge tone and reflection.
- Water film adds texture without hiding geometry.

Rebuild R02 as a private master study

- Photograph one neutral bottle on a pale surface.
- Build edge separation with cards, not an outline effect.
- Retain label and product geometry exactly.
- Add real or photographed moisture only if physically plausible.
- Match highlight roll-off before adding grain.

Target: product remains accurate while still feeling tactile and hydrated.

R03 original reference - Highlight Milk - skin/product crop

Write the three-second read first. Do not begin with retouching settings.

R03 - reduce the image before rebuilding it

ORIGINAL

GRAYSCALE

BLURRED READ

VALUE GROUPS

- First read: eyes, then cheek highlight and lip.
- Soft global light coexists with crisp local speculars.
- Retouch keeps brows, pores, and small asymmetries.

Rebuild R03 as a private master study

- Shoot a tight beauty crop with a controlled soft source.
- Create separate skin-tone and specular masks.
- Remove distractions without changing anatomy.
- Use micro dodge-and-burn before any texture separation.
- Review at 100 and 200 percent for synthetic patches.

Target: dewy rather than greasy; refined rather than plastic.

Dewy and greasy separate at the highlight map

DEWY

- Small controlled speculars
- Broad soft gradients
- Pores and local color remain
- Highlights support facial form

GREASY / SYNTHETIC

- Random hot spots
- Clipped forehead and nose
- Uniform blur under shine
- Highlights ignore facial planes

Moisture is not a global effect. It is a local surface and lighting decision.

Clean is organized; empty is unresolved

CLEAN

- One clear hero
- Quiet supporting texture
- Tonal separation
- Intentional whitespace
- Edge and shadow control

EMPTY

- No secondary event
- Flat background
- Weak depth
- Unmotivated crop
- No tactile information

Minimal images still need hierarchy, texture, depth, and commercial function.

Rhode test: clean the frame without erasing reality

Do not combine Rhode softness with Jacquemus scale inside the practice drill.

- Choose R01 for portrait hierarchy and natural skin.
- Choose R02 for white-on-white product separation.
- Choose R03 for macro specular control.
- Do not copy product packaging for public work.
- Judge skin and product geometry before judging color style.

03

The technical reconstruction

Capture enough evidence, rebuild only what the image needs, and integrate in layers.

Shoot for CGI before you need CGI

- RAW original, locked exposure, focal length, camera height, and distance.
- Clean plate, gray card, color reference, and light-position photo.
- Chrome or reflective reference and a neutral matte sphere when available.
- Shadow reference, background plate, focus plates, and extra framing.
- Garment detail, wrinkles, hardware, and alternate crops.

Camera match is a constraint problem

- Set image aspect ratio and sensor assumptions.
- Align horizon and verticals before matching object scale.
- Use known dimensions to anchor real-world scale.
- Adjust focal length and camera distance together.
- Do not use lens distortion to hide a perspective mismatch.

Lighting reference removes guesswork

- Start with one motivated key matching direction and softness.
- Add environment fill and negative fill separately.
- Use reflected cards to shape glossy materials.
- Check the cast shadow before fine material work.
- Render a gray material test before polishing the shader.

Blender scope: only skills that support the composite

- Real-world scale, simple modeling, bevels, normals, and smooth shading.
- Cycles, denoising, HDRI, area lights, and transparent film.
- Roughness, coat, metallic, transmission, IOR, normal, and bump.
- Shadow catcher, object masks, Cryptomatte, and render passes.
- OpenEXR when range and pass control justify the extra complexity.

Real-world scale stabilizes light, bevels, and depth

- Model a measured object, not an eyeballed object.
- Use centimeters or meters consistently.
- Match bevel radius to the real edge, not the screen zoom.
- Depth of field depends on camera, distance, aperture, and scale.
- A scale error can masquerade as a material or lighting error.

Geometry earns the highlight before the shader does

- Use enough bevel for a readable edge highlight.
- Control normals and shading on broad surfaces.
- Avoid mathematically perfect razor edges.
- Match silhouette before adding microdetail.
- Keep product geometry accurate when the object is real.

Material realism is a three-way interaction

- Object shape controls the path of reflection.
- Material parameters control reflection spread and energy.
- The environment supplies the reflected image.
- Changing roughness alone cannot create a premium highlight.
- Test the shader under at least two lighting setups.

Reflection design is product lighting

- Large white cards create broad gradients.
- Narrow strips describe curvature and edges.
- Black cards create shape through negative reflection.
- Curved cards prevent abrupt highlight endings.
- The reflected environment must agree with the photographic plate.

Chrome and glass expose every weak decision

- Chrome needs a designed environment because nearly all visible color is reflection.
- Glass needs accurate IOR, thickness, transmission, and background interaction.
- Avoid perfectly clean surfaces; add controlled microvariation.
- Keep caustic and dispersion effects only when the plate supports them.
- Check edges against both dark and light backgrounds.

Shadow catchers help, but they do not solve the composite

- Match plane orientation and scale.
- Match light direction and softness before shadow density.
- Keep ambient contact and cast shadow editable.
- Inspect indirect color spill from the CGI object.
- Treat inferred floor material and light as estimates until tested.

Render passes separate decisions

- Beauty pass for reference, not as the only handoff.
- Shadow and ambient/contact information when supported.
- Diffuse, glossy, transmission, and emission only when they help diagnose.
- Cryptomatte or object/material masks for precise adjustment.
- Z or mist data only when depth treatment is justified.

OpenEXR preserves range and pass control

- Use 16-bit half float for most practical compositing.
- Keep data passes linear and document the view transform.
- Confirm Photoshop or the chosen compositor reads the channels correctly.
- Do not add a complex EXR workflow when PNG plus clean masks is sufficient.
- Archive render settings with the source scene.

Photoshop layer order should expose the logic

- 00_REFERENCE / 01_RAW_BASE / 02_CLEANUP
- 03_SUBJECT_MASK / 04_CGI_OBJECTS / 05_CONTACT_SHADOWS
- 06_REFLECTIONS / 07_LIGHT_WRAP / 08_COLOR_INTEGRATION
- 09_DODGE_BURN / 10_TEXTURE_GRAIN / 11_GLOBAL_GRADE
- 12_OUTPUT - with source files and linked Smart Objects preserved.

Mask quality is judged at the transition, not the thumbnail

- Use Select Subject as a starting point, not proof.
- Refine hair and fabric at the final output scale.
- Remove edge contamination from the old background.
- Match the source blur before adding light wrap.
- Check the mask on black, white, and the final plate.

Contact shadow and bounced light sell weight

- Separate tight contact, broad cast, and ambient occlusion.
- Use the source shadow edge as the softness reference.
- Add colored bounce only where nearby surfaces justify it.
- Reduce opacity by zooming out, not by guessing at 200 percent.
- Check that every shadow points back to a plausible light.

Match depth and grain after geometry and light

- Match focus plane and blur falloff, not one global blur value.
- Scale grain with the image, not with the inserted object's original resolution.
- Match sharpening halos and edge acuity.
- Add grain late and inspect at output size.
- If CGI remains too sharp, check geometry and contrast before blur.

Resolve 21 adds a Photo page - use it deliberately

- Photo page: organize, rate, process RAW stills, and apply nondestructive grades.
- Color page: scopes, node order, qualifiers, windows, and look development.
- Photoshop still leads for detailed layer composites and retouching in this course.
- Resolve leads for campaign consistency, motion, shot matching, and delivery.
- Do not round-trip stills without a clear color-management plan.

04

Why it looks fake

Diagnose the first broken physical relationship instead of adding polish.

Perspective mismatch

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: lines and scale imply different cameras.
- Correction: align horizon and vanishing point; then solve lens and distance.
- Mini drill: overlay plate and render at 50 percent opacity.

Floating object

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: no tight contact or weight deformation.
- Correction: add contact, cast, and ambient shadow separately.
- Mini drill: remove the object and rebuild only its shadow system.

Wrong highlight direction

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: glossy object reflects a light that does not exist in the plate.
- Correction: rebuild the reflected cards and environment.
- Mini drill: gray-shade the object and solve reflection before color.

Black and white levels do not share a world

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: inserted blacks clip or whites float above the plate.
- Correction: match neutral balance, toe, shoulder, and local contrast.
- Mini drill: compare on waveform and grayscale.

Depth and grain mismatch

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: one element looks cut from a sharper camera.
- Correction: match focus, motion/defocus blur, edge acuity, and grain scale.
- Mini drill: judge at final delivery resolution.

Plastic skin or fake water

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: repeated highlights, uniform blur, and impossible droplets.
- Correction: preserve texture and respect gravity, surface tension, and light direction.
- Mini drill: remove the effect until the base photo works again.

Over-clean CGI

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: perfect edges and uniform surfaces read as synthetic.
- Correction: add measured bevels, microvariation, and environment-specific reflection.
- Mini drill: compare silhouette and highlight breakup at 200 percent.

Product truth failure

Fix the physical relationship before adding glow, clarity, or a global look.

- Brain signal: seams, color, fit, label, or geometry changed.
- Correction: return to the real source and rebuild the mask or object.
- Mini drill: make a side-by-side accuracy checklist before grading.

05

Eight-week execution

Every week ends in an artifact, a score, and a revision decision.

W1

Taste and master-study discipline

Learn to see hierarchy before touching software.

- Complete 7 daily teardowns.
- Analyze J01, J02, J03, R01, R02, and R03.
- Select one Jacquemus drill to rebuild in Week 2.
- Score references with the same rubric used on your work.

WATCH WITH A JOB

No new tutorial this week. Work directly from the official references and course worksheets.

Deliverable: Week_01_Taste_Library.pdf

W2

Photography and RAW source control

Capture a plate that can survive compositing.

- Photograph one model and one product in RAW.
- Record focal length, height, distance, and light placement.
- Create clean plate, gray card, and shadow references.
- Develop nondestructively in Camera Raw.

WATCH WITH A JOB

[Discover Masking in Camera Raw | Adobe Photoshop](#)

Adobe Photoshop | 29:40 | watch 0:00-12:00;
18:00-29:41

Deliverable: Week_02_Photography_Test.pdf

W3

Premium shine and reflection design

Make three distinct highlight shapes on one object.

- Window-light glossy-object test.
- White-card and black-card reflection test.
- Black-denim texture test.
- White-product edge test.
- Label shiny, plastic, and premium-glossy failures.

WATCH WITH A JOB

Blender | 6:42 | watch 0:00-6:43

Fundamentals of Lighting in Blender

Blender Guru | 43:25 | watch 0:00-12:00; 20:00-36:00

+ 1 more verified lesson(s) in the curriculum CSV

Deliverable: Week_03_Shine_Lab.pdf

W4

Blender for fashion compositing

Build only the CGI elements needed by the plate.

- Match one real camera.
- Build red lacquer, chrome, stone, glass, and wet-floor tests.
- Use real-world scale and measured bevels.
- Render transparent background, masks, and shadow information.

WATCH WITH A JOB

BLENDER BASICS 20 - Materials and Lighting

CG Cookie – Learn Blender | 13:17 | watch 0:00-13:17

Deliverable: Blend files + asset library + first composite

W5

Photoshop integration and retouching

Make separate elements feel photographed together.

- Use the required layer stack.
- Build contact, cast, and ambient shadows.
- Match color, depth, edge contamination, and grain.
- Preserve skin and clothing texture.
- Create a before/after breakdown.

WATCH WITH A JOB

Match Color with 3 Major Clicks in Photoshop!

Master Shadows & Lighting in Compositing with Photoshop!

PixImperfect | 36:02 | watch 0:00-14:00, 20:00-34:00

Deliverable: Week_05_Compositing_Breakdown.psd

W6

Color and campaign consistency

Balance first, look second, match third.

- Create a neutral balance for three frames.
- Build one restrained look with labeled nodes or layers.
- Protect skin, whites, black denim, and burgundy.
- Use scopes to confirm - not replace - visual judgment.
- Save gallery stills and match notes.

WATCH WITH A JOB

Deliverable: VORG look-development sheet + node tree

W7

Resolve, motion restraint, and system QA

Use motion and Fusion only when they improve the campaign idea.

- Bring one still system into Resolve 21.
- Build a 6-second teaser with one controlled motion event.
- Check shot matching, scopes, grain, and highlight roll-off.
- Audit every frame for garment and identity truth.
- Revise anything below 75.

WATCH WITH A JOB

DaVinci Resolve 17 Fusion Training - Introduction to Fusion

38:00-55:00

Deliverable: Week_07_Motion_Consistency_Test.mp4

W8

VORG capstone campaign

Deliver six related images using VORG-owned source material.

- Model hero with one CGI idea.
- Product-only still life.
- Macro texture image.
- Canadian environmental image.
- Clean commercial image.
- Controlled experimental image.

WATCH WITH A JOB

No new tutorial this week. Work directly from the official references and course worksheets.

Deliverable: Six masters + adaptations + breakdowns

The capstone is a six-image system

Adapt approved masters to portrait, square, hero, mobile hero, story, poster, and email banner.

- 1. Model hero: real model, real garment, one CGI element.
- 2. Product still: garment or scarf treated as an art object.
- 3. Macro: denim, stitching, hardware, moisture, or skin.
- 4. Environment: lake, stone, concrete, glass, water, or architecture.
- 5. Commercial: clear product presentation for site or paid media.
- 6. Experimental: one controlled surreal idea.

Score every major exercise out of 100

Below 75 must be revised. Portfolio-ready starts at 85 with no major realism error.

- Composition and hierarchy: 20
- Lighting logic: 15
- Material realism: 15
- Perspective and scale: 15
- Shadow and reflection integration: 15
- Color discipline: 10
- Product truthfulness: 5
- VORG originality: 5

Begin Week 1 with J01 - and do not open Blender

The first result is a sharper eye. Software comes after the visual target is clear.

- Set a three-second timer and write the first visual event.
- Review the grayscale, blurred, and value-group files.
- Trace the three largest shapes in the workbook.
- Estimate camera height and key-light direction; label both as estimates.
- Write what you would remove.
- Then repeat with R02 and compare your observation speed - not the styles.

Sources and acknowledgements

All inferred camera and lighting notes are estimates. Brand images remain the property of their respective owners.

- Official Jacquemus site and collection pages - 20 indexed references.
- Official Rhode site and product pages - 20 indexed references.
- Blender 5.1 manual and official Blender channel.
- Adobe Photoshop and Camera Raw documentation and Adobe Photoshop channel.
- Blackmagic Design Resolve 21 product, Photo, training, and new-features pages.
- PiXimperfect, CG Cookie, Blender Guru, Casey Faris, Darren Mostyn, and The Blenderender for selected focused lessons.
- Full URLs, access dates, categories, and usage notes live in source_manifest and youtube_curriculum.
